ПРЕДИСЛОВИЕ.

При землеустроительных работах землемерные техники, не имеющие об своем распоряжении арифмометров, встречают большие затруднения при выч площадей по координатам вершин полигона, так как пользование больш имеющихся в печати таблиц (О'Рурка Zimmermann-a, Crelle и др.) значительные неудобства вследствие того, что при этом необходимо и мн и множитель разбивать на несколько групп и производить умножение по час

Значительно более удобным является умножение в том случае, если под тому, как это сделано в известных таблицах Гаусса для вычисления прямоуголы координат, один множитель целиком помещается в таблицах, и лишь другой раз вается на несколько частей по числу заключающихся в нем цифр.

Весьма важным является то обстоятельство, что при таком принципе сос ления таблиц умножения нахождение и приращений и произведений потребует логичных навыков, и тем самым увеличена будет вероятность правильности результ

По этому принципу и составлены таблицы Дьякова и Орлова, но как в так и других множимое изменяется через каждую единицу, и вследствие этого рые из указанных таблиц содержат множимое недостаточной величины и не поэтому удовлетворить своему назначению при вычислении площадей, а перг этим недостатком и не страдают, но зато чрезвычайно громоздки и дороги

Между тем в подготовленной в данный момент к изданию Государ Издательством в Москве моей работе „Землеустроительное проэктирование" показано, что при вычислениях без наличия арифмометра является нерациональ записывать исправленные приращения, а следовательно также координаты разности со всеми сотыми долями, и эти последние следует округлять до сотых, а такого рода подход уже дает возможность произвести составление по указанному выше принципу, избегнув недостатков, свойственных табл Дьякова и Орлова.

К настоящим таблицам приложены таблицы квадратов чисел от 0 до 200

К таблицам Гаусса также приложены таблицы квадратов чисел от 0 до 10,0 делающие возможность находить квадраты чисел до 1000,00, но с переходом к ме рической системе и замене сажени метром численные величины линий увели ются, и представилось необходимым поэтому довести эти таблицы до 2000,00

Приложены также таблицы натуральных значений Sin, cos, tg, и ctg.

Проф. В. Киркор.

Об'яснение таблиц.

Способ пользования настоящими таблицами выясняется нижеследующих примеров.

Пример 1. Найти произведение $384{,}15 \times 875{,}35$. Ищем в таблицах стр которой множимым (расположенным по обоим концам этой строки) является 384,15.

Так как далее

$$384{,}15 \times 875{,}35 = 384{,}15\ (800 + 70 + 5 + 0{,}30 + 0{,}05),$$

то умножение в данном примере может быть сведено к нахождению и ванию на счетах произведений числа 384,15 на 800, затем на 70 и т. д.

В пересечении с указанной строкой столбцов, вверху которых находятс 10,20.....90, расположены произведения 384,15 на эти числа, поэтому нет ственно в таблицах находим, что

$$384{,}15 \times 70 = 26\ 890{,}5,$$

произведения же

$$384{,}15 \times 800 \text{ и } 384{,}15 \times 5$$

получаются посредством соответственного перенесения запятой в произведения

$$384{,}15 \times 80 \text{ и } 384{,}15 \times 50\ ;$$

что же касается произведений

$$384{,}15 \times 0{,}30 \text{ и } 384{,}15 \times 0{,}05,$$

то их следует находить так же, как и произведения

$$384{,}15 \times 30 \text{ и } 384{,}15 \times 5,$$

но считать при этом результат в сотых долях.

Таким образом все произведение выразится следующей суммой:

$$\begin{array}{rr} & 307\ 320{,}0 \\ & 26\ 890{,}5 \\ + & 1\ 920{,}75 \\ & 115{,}245 \\ & 19{,}2075 \\ \hline & 336\ 265{,}7025 \end{array}$$

Пример 2. Найти произведение $851{,}30 \times 754{,}20$.

В этом случае оба сомножителя больше 500 и ни одного из них це иметь в таблицах мы не можем; представляем поэтому наше произведение в так виде:

$$(1000 - 148{,}70) \times 754{,}20 = 1000 \times 754{,}20 - 148{,}70 \times 754{,}20,$$

кладем на счетах

$$1000 \times 754{,}20 = 754200$$

и отнимаем от этого количества найденное так же, как и в предыдущем произведение

$$148{,}70 \times 754{,}20.$$

		.0	11.70
		1075,5	11.75
		1080.0	11.80
			11.85
			11.90
			11.95
			12.00
70	80	90	N

Пример 3. Найти произведение $1234{,}30 \times 657{,}85$.

Легко видеть, что данная операция может быть сведена к следующей:

$$1234{,}30 \times 657{,}85 = (1000 + 234{,}30) \times 657{,}85 = 1000 \times 657{,}85 + 234{,}30 \times 657{,}85.$$

Данными таблицами можно пользоваться также и для производства деления двух чисел, если делитель не превосходит числа 500,00, как это видно из нижеследующих примеров.

Пример 4. Найти частное $375000 : 447{,}15$.

Так как делимое наше заключается между числами

$$447{,}15 \times 1000 = 447\,150 \text{ и } 447{,}15 \times 100 = 44\,715,$$

едовательно, искомое частное должно быть больше ста и меньше тысячи, т.-е., иметь в себе сотни, десятки и т. д.; так как сверх того делимое заключается чмслами

$$447{,}15 \times 800 = 357720 \text{ и } 447{,}15 \times 900 = 402435,$$

ое должно быть больше 800 и меньше 900, из чего заключаем, что в нем сотен и некоторое количество десятков, единиц и проч.

ложив на счеты делимое 375000 и отняв от него произведение

$$447{,}15 \times 800 = 357720$$

им остаток

$$375000 - 357720 = 17280,$$

орый будем делить подобно предыдущему на число 447,15 и получим последовательно.

гков . . .	3	и при этом остаток	17280	$-447{,}15 \times 30$	$=3865{,}5$	,
иц	8	„ „ „ „	3865,5	$-447{,}15 \times 8$	$=288{,}3$	,
ых долей	5	„ „ „ „	288,3	$-447{,}15 \times 0{,}6$	$=20{,}01$	и
к „	4	„ „ „ „	20,01	$-447{,}15 \times 0{,}04$	$=2{,}124.$	

Отбрасывая последний остаток без увеличения в данном случае последней фры частного, получим окончательно

$$375000 : 447{,}15 = 838{,}64$$

Пример 5. Найти частное $52500 : 385{,}67$.

Так как в таблицах делители берутся округленными до 0,05, то произведем дварительно деление так же, как и в предыдущем примере, на 385,65 и получим ,13 с некоторым остатком.

Чтобы найти затем для этого частного поправку, соответствующую истинной ве- не делителя, примем во внимание то обстоятельство, что с уменьшением дели- против иситнной величины частное увеличилось против своей истинной величины итом в том же отношении, и так как относительное уменьшение делителя равно , а относительное увеличение частного равно $\frac{0{,}01X}{136{,}13}$, где X означает число долей абсолютного увеличения, то имеем равенство

$$\frac{0{,}02}{385{,}67} = \frac{0{,}01X}{136{,}13},$$

или иначе

$$\frac{2}{385{,}67} = \frac{X}{136{,}13},$$

что даст нам

$$\frac{X}{2} = \frac{136{,}13}{385{,}67},$$

ли окончательно

$$X = 2 \times \frac{136{,}13}{385{,}67}.$$

Отсюда находим, что X = (с округлением) 1, и истинная величина частного окажется равной

$$136{,}13 - 0{,}01 = 136{,}12.$$

Но при этом мы должны иметь в виду, что частное 136,12 заключает в себе погрешности от двух округлений—при делении на 385,65 и при нахождении величины X, и если бы нам потребовалось почему либо иметь результат более точным то мы должны были бы проверить, как повлияло на величину частного округлен его до сотых долей при первоначальном делении и округление X, и если бы о залось, что оба эти округления влияют в одну и ту же сторону, то нужно было приблизительно подсчитать, не составится ли вместе погрешность от округле большей, чем половина сотой доли. Действительно, в данном случае мы имее отбрасывание остатка при первоначальном делении, или иначе, округление час уменьшило его величину приблизительно на $^1/_3$ сотой доли, и округление пр зительно на $^1/_3$ величины X также уменьшило величину частного, и таким об получилось общее уменьшение от обоих округлений приблизительно на $^2/_3$ доли, и следовательно частное будет более точным, если мы возьмем его

$$136{,}12 + 0{,}01 = 136{,}13.$$

Обобщая рассуждения предыдущего примера, находим, ч при округлении делитель уменьшается, то полученное частное подлежит уменьшению и наоборот; что же касается самой вели поправки частного, то она находится в таком же отношении к личине погрешности от округления делителя, как самые величи частного и делителя, и легко находится, так сказать, с перво взгляда, так как выражается небольшим числом взятых с округ нием сотых долей.

Пример 6. Найти высоту трапеции, площадь которой равна 9,5 гектаров, сумма оснований 647,57 м.

Так как средняя линия трапеции будет здесь

$$647{,}57 : 2 = 323{,}785 \text{ м.},$$

а площадь трапеции, в переводе на квадратные метры, равна

$$9{,}5 \times 1000 = 95000,$$

то высота представит собою частное

$$95000 : 323{,}785.$$

Выполняя, подобно тому, как и в предыдущем примере деление

$$95000 : 323{,}80,$$

получим приближенное частное равным 239,39 и поправку на него в сторону у чения, равную

$$1{,}5 \times \frac{293{,}39}{323{,}785} = \text{(с округлением) 1 сотой доле}$$

или окончательно

$$293{,}39 + 0{,}01 = 293{,}40.$$

До употребления исправить следующие опечатки.

ТАБЛИЦЫ
КВАДРАТОВ ЧИСЕЛ

Настоящие таблицы дают возможность находить квадраты всех чисел от 0 до 2000,00 и, наоборот, по квадратам их находить самые числа.

Но при этом для упрощения вычислений отбрасывается в квадратах вся дробная часть, обычно, не имеющая практического значения, но загромождающая их лишними знаками.

Например, по этим таблицам площадь квадрата со стороною в $235{,}10\,м$ принимается равной $55272\,м^2$, а не $55272{,}0100\,м^2$, т. е., производится округление результата, что вполне понятно, так как доли квадратного метра при вычислениях землеустроительного характера, обычно, значения не имеют.

Таблицы составлены таким образом, что в столбце N помещается целая часть возводимого в квадрат числа, десятые доли находятся сверху других столбцов, а сотые в боковых табличках Р. Р.

Пользование таблицами уясняется из приводимых ниже примеров.

Возведение в квадрат.

Пример 1. Найти квадрат числа 235,10.

Открываем страницу таблиц, ищем строку, для которой в столбце N помещается число 235 и на пересечении этой строки со столбцом, соответствующим 1-й десятой, находим число 5272, приписывая к этому числу слева 5 из столбца N^2 для цыфр разрядов, начиная с пятого, являющихся общими для многих квадратов, получим результат равный 55272, и, таким образом, имеем:

$$235{,}10^2 = 55272.$$

Пример 2. Найти квадрат числа 235,16.

Имея из предыдущего примера, что

$$235{,}10^2 = 55272,$$

находим табличную разность

$$235{,}20^2 - 235{,}10^2 = 47$$

и в боковой табличке Р. Р, соответствующей этой разности, подобно тому, как это делается в общеизвестных таблицах логарифмов, находим поправку для 0,06, равную 28,2, и тогда весь результат будет

$$\begin{array}{r} 55272 \\ +\quad 28{,}_2 \\ \hline 55300_2 \end{array}$$

или с округлением

$$55300$$

Сложение здесь, обыкновенно, выполняется помощью счетов.

Извлечение квадратного корня.

Пример 1. Найти квадратный корень из числа 174315.

На странице 187 таблиц в столбце N^2 находим число 17, а в строке, соответствующей числу N=417, в столбцах для 5 и 6 десятых долей находим числа 4306 и 4390, между которыми заключается число 4315, составляющее 4 последние цифры заданного числа.

Беря табличную разность

$$4390 - 4306 = 84$$

и определяя разность между заданным числом и 4306, равную

$$4315 - 4306 = 9,$$

находим по боковой табличке Р. Р. для разности, равной, 84, что

$$\text{а} \begin{matrix} 0{,}01 \text{ соответствует } 8{,}_4, \\ 0{,}02 \quad \text{„} \quad 16{,}_8, \end{matrix}$$

из чего заключаем, что искомое число находится между

$$417{,}51 \text{ и } 417{,}52$$

и ближе к 417,51, вследствие чего и принимаем его равным

$$417{,}51.$$

Пример 2. Найти квадратный корень из числа 253449,1782.

Так как квадраты чисел даются в таблицах округленными до целых единиц и лишь в табличках Р. Р. имеются и десятые доли, те иметь значение для результата могут лишь эти доли, и заданное число следует поэтому предварительно округлить до десятых долей, взяв его равным

$$253449{,}_2$$

и тогда, подобно тому, как и в предыдущем примере, найдем, что

$$\sqrt{253449{,}_2} = \sqrt{253412 + 37{,}_2} = \sqrt{503{,}4^2 + 37{,}_2} = 503{,}44$$

Примеры более сложных вычислений.

Пример 1. Найти $c = \sqrt{a^2 + b^2} = \sqrt{575{,}27^2 + 695{,}62^2}$

$$\begin{matrix} 575{,}27^2 = & 330855 + 80{,}_5 \\ + 695{,}62^2 = & + 483859 + 27{,}_8 \end{matrix}$$

$$c^2 = 814822{,}_3 = 814687 + 135{,}_3 = 902{,}6^2 + 135{,}3 = 902{,}68$$

и $c = 902{,}68$

Пример 2. $a' = \sqrt{a^2 + 2Q\operatorname{tg}\alpha}$ *) $= \sqrt{425{,}39 + 2 \times 23450 \times 0{,}25645}$

Найдем сначала по прилагаемым таблицам умножения произведение

$$2 \times 23450 \times 0{,}25645 = 46900 \times 0{,}25645 = \frac{46900}{1000} \times (0{,}25645 \times 1000) =$$

$$= 46{,}90 \times 256{,}45 = 256{,}45\ (40 + 6 + 0{,}9),$$

что дает:

$$\begin{matrix} 10258{,}_0 \\ + 1538{,}_7 \\ + 230{,}_8 \\ \hline 12027{,}_5 \end{matrix}$$

после этого имеем:

$$\begin{matrix} 425{,}39^2 = 180880 + 76{,}_5 \\ + \qquad 12027{,}_5 \\ \hline a'^2 \quad = 192984{,}_0 \end{matrix}$$

и отсюда

$$a' = \sqrt{192984{,}_0} = 439{,}30$$

*) См. Киркор „Землеустроительное проектирование". Москва, Госиздат, 1925 г., стр. 241.

В последнем примере значение $\operatorname{tg}\alpha$ берется из прилагаемых в настоящей книге пятизначных таблиц натуральных значений tg; при чем для удобства умножения целесообразно округлять эти значения до 5 единиц последнего знака.

Результат умножения мы записываем не точно, а лишь с десятыми долями, так как в примере 2 на извлечение корня нами показано, что большей точности при нахождении a' не нужно; имели бы значение остальные цифры произведения для проверки правильности производства умножения (например, девяткой), но так как вообще величина a' легко поверяется другим, указанным в моем курсе „Землеустроительное проектирование" способом, то в этом необходимости не встречается.

Пример 3. $c = \sqrt{a^2 + b^2} = \sqrt{2{,}35^2 + 1{,}28^2}$.

Легко видеть, что непосредственное пользование прилагаемыми таблицами дало бы в данном случае грубый результат, и поэтому является необходимым применить в этом примере перенесение запятой путем деления и умножения подкоренного выражения на 100^2; после чего получим:

$$c = \sqrt{\frac{1}{100^2} \times (2{,}35^2 + 1{,}28^2) \times 100^2} = 0{,}01 \times \sqrt{2{,}35^2 \times 100^2 + 1{,}28^2 \times 100^2} =$$

$$= 0{,}01 \times \sqrt{235^2 + 128^2} = 0{,}01 \times \sqrt{55225 + 16384} = 0{,}01 \times \sqrt{71609} =$$

$$= 0{,}01 \times 2{,}67_6 = (\text{с округлением})\ 2{,}68$$

Вычисления типа последнего примера встречаются при определении величины невязки полигона или хода по невязкам в X и У.

Применение таблиц квадратов чисел для целей умножения.

Таблицы квадратов чисел могут быть использованы и для целей умножения, так как

$$(a + b)^2 - (a - b)^2 = 4ab,$$

и следовательно

$$ab = \frac{(a + b)^2 - (a - b)^2}{4},$$

то для нахождения учетверенного произведения ab достаточно найти по таблицам квадратов чисел

$$(a + b)^2 \text{ и } (a - b)^2$$

и взять их разность; для нахождения же просто произведения ab или нужно так составить таблицы, чтобы в них даны были не полные квадраты, а четверти их, подобно тому, как это сделано, например, у Blater'a (Вена), или уменьшить произведение путем деления одного из сомножителей либо окончательного результата — на 4, что необходимо при пользовании настоящими таблицами.

Пример 1. Перемножить числа 475,15 и 387,12.

По разделении второго из этих чисел на 4 имеем 96,78.

Далее находим:

$$\begin{matrix} (475{,}15 + 96{,}78)^2 = & 571{,}93^2 = & 327070 + 34{,}_2 \\ - (475{,}15 - 96{,}78)^2 = & - 378{,}37^2 = & - 143111 - 53{,}_2 \end{matrix}$$

$$475{,}15 \times 387{,}12 = 183940$$

Напомним, что сложение и вычитание выполняются при этом на счетах.

Пример 2. Перемножить числа 573,13 и 421,75.

Так как ни один из сомножителей не делится на 4, то разделим на это число нейденный результат.

$$\begin{matrix} (573{,}13 + 421{,}75)^2 = & 994{,}88^2 = & 989627 + 159{,}_2 \\ - (573{,}13 - 421{,}75)^2 = & - 151{,}38^2 = & - 22892 - 24{,}_0 \end{matrix}$$

$$4 \times 573{,}13 \times 421{,}76 = 966870{,}_2$$

и $573{,}13 \times 421{,}75 = \frac{1}{4} \times 966870{,}_2 = 241717{,}_6 = (\text{с округлением})\ 241718$

В обоих последних примерах оказалось необходимым при пользовании таблицами квадратов чисел для целей умножения производить деление на 4, что создает лишнее действие, но в некоторых примерах более сложных вычислений это неудобство отсутствует, что увидим из последующего примера.

Пример 3. $a' = \sqrt{a^2 + 2Q\operatorname{tg}\alpha} = \sqrt{347{,}12^2 + 2 \times 57850 \times 0{,}23784}$.

Для вычисления величины

$$2 \times 57850 \times 0{,}23784$$

при помощи таблиц квадратов чисел нам нужно предварительно уменьшить ее в 4 раза, для чего отбрасываем множитель 2 и последний из 2-х других сомножителей делим на 2 (лишнего действия таким образом уже не вводится), после чего имеем:

$$\frac{1}{4} \times 2 \times 57850 \times 0{,}23784 = 57850 \times 0{,}11892 =$$

$$= \frac{57850}{1000} \times (0{,}11892 \times 1000) = 57{,}85^*) \times 118{,}92;$$

$$(57{,}85 + 118{,}92)^2 = 176{,}77^2,$$

$$(118{,}92 - 57{,}85)^2 = 61{,}07^2;$$

и таким образом получаем:

$$a' = \sqrt{347{,}12^2 + 176{,}77^2 - 61{,}07^2}$$

Дальнейшие вычисления ведем совместно, пользуясь счетами:

$$\begin{array}{rrr} 347{,}12^2 = & 120478 & + 14{,}_0 \\ + 176{,}77^2 = & 31223 & + 24{,}_5 \\ - 61{,}07^2 = - & 3721 & - 8{,}_4 \\ \hline \end{array}$$

$$a'^2 = 148010{,}_1 = 147994 + 16{,}_1 = 384{,}7^2 + 16{,}_1 = 384{,}72^2$$

и $a' = 384{,}72$

При сравнении особенностей умножения при помощи таблиц умножения и при помощи таблиц квадратов чисел обнаруживается, что тот и другой способ имеет свои достоинства и свои недостатки.

По таблицам умножения можно получить результат совершенно точным, без округления, что дает возможность произвести поверку правильности его обычным способом, например, девяткой, а это имеет важное значение при выполнении большого количества умножений с общей поверкой результата, например, при определении площади полигона по координатам вершин.

Если бы при этом, суммируя произведения, мы убедились, что результат неверен, то, работая таблицами умножения, мы могли бы обнаружить ошибку девяткой, а при пользовании таблицами квадратов чисел нам нужно было бы для проверки повторить вычисления, что невыгодно, и, таким образом, в этом случае таблицы квадратов чисел имеют значительные неудобства.

При выполнении же таких умножений, где поверка может быть применена после небольшого числа вычислений, как в последнем примере, и таблицы квадратов чисел имеют свои крупные достоинства, так как они дают произведение двух любых чисел до 1000 00 со всеми сотыми долями (без округления их во множимом до 0,05), благодаря чему в тех случаях, когда оба сомножителя больше 500,00, таблицами квадратов чисел может быть получен результат скорее, а так как по этим таблицам не требуется округления пятизначного сомножителя, то результат этот обычно будет и точнее.

Таким образом, таблицы квадратов чисел не могут претендовать на универсальное применение для целей умножения, но во многих случаях они оказываются и для этих целей очень полезными.

*) Результат получился-бы несколько более точным, если бы вместо $57{,}85 \times 118{,}92$ мы взяли $\frac{1}{10}(578{,}50 \times 118{,}92)$.

ТАБЛИЦЫ

натуральных значений tg, sin и cos.

Во всех случаях землеустроительной практики, когда в применяемые в вычислениях формулы входит tg, наиболее быстро получается результат путем использования приводимых ниже таблиц натуральных значений tg.

Пользование этими таблицами слишком просто и не нуждается в об'яснениях, а применение их для различных вычислительных операций производится либо на арифмометре, либо помощью таблиц умножения, и в частности помощью применяемых для целей умножения таблиц квадратов чисел.

Пользование таблицами при наличии арифмометра сводится к подстановке из таблиц в формулы вместо tg его натурального значения и производству соответствующих вычислений; пользование этими таблицами совместно с таблицами квадратов чисел рассмотрено в об'яснениях к этим последним таблицам; особенности же пользования совместно с таблицами умножения вытекают из нижеследующего примера.

Пример 1. Найти произведение 35440 tg 16°14′.

Из таблиц имеем

$$\operatorname{tg} 16^\circ 14' = 0{,}29116,$$

и, таким образом, операция сводится к нахождению произведения

$$35440 \times 0{,}29116;$$

а так как в наших таблицах умножения множителем является число с 2-мя десятичными знаками, то сомножители искомого произведения предварительно преобразуем перенесением запятой, после чего получим

$$35{,}44 \times 291{,}16,$$

а действие же такого рода уже легко выполняется при помощи таблиц умножения.

В таблицах приведены значения tg через одну минуту, и табличек P.P. для долей минуты не приведено, так как практически в них надобность не встречается, а места они занимают много.

Таблицы натуральных значений sin и cos приведены лишь для случая пользования ими при наличии арифмометра, и в этом случае могут с пользой заменить таблицы Гаусса, имея для sin и cos лишний знак и давая поэтому более точный результат.

К указанным таблицам приложены таблички P.P. для нахождения значений sin и cos для десятых долей минуты.

Значения эти могут быть полезны для промежуточных вычислений при проектировании крупных площадей с длинными линиями, при которых округление угла на несколько десятых долей минуты дает уже значительное отклонение конца линии и вызывает заметную погрешность от этого округления.
